

A: Please try to do Install, Test and then Uninstall of Clone Manager Pro, If its not working, install Microsoft Visual C++ Redistributable 2015, if not working then install Microsoft Visual C++ Redistributable 2017, that should solve the issue. USGS Photo archives Huntsville, AL (2017) Streambank area is in Alabama, at the confluence of the Coosa River and Tallapoosa River. The site was impacted by mining and infrastructure development. The intent of the photograph was to compare the aerial extent of the streambank disturbance with that of the water surface through images collected with a LIDAR (Light Detection and Ranging). The LIDAR was mounted on a modified drone platform with tilt capability, aimed to capture images to simulate the view of a geospatial analyst using aerial imagery. The effect of sediment removal was simulated by cutting the streambank on the ground, showing how the visual effect is lost when the water surface is visibly disturbed. Click the thumbnails below to see a larger image, then click on the photo to see the larger version at the U.S. Geological Survey. On 9 August, students from the Camperdown School in Western Sydney, Australia, conducted environmental monitoring surveys to examine the impact of an abandoned lead/zinc smelter, located in the suburb of Wetherill Park, on a permanent wetland. View of the smelter site and the monitoring work. This aerial photograph shows the extent of streambank erosion on the Leopold and Fitzroy rivers near the town of Archerfield, Brisbane, Queensland, Australia. Streambank erosion can occur when alluvial sediments are removed and deposited in areas where water moves slowly or when the bank is subject to a longshore transport of sediment. Water moves laterally along the streambed, and the direction of water flow is determined by the contours of the catchment area.
