Focal adhesion kinase (FAK) has been shown to contribute to platelet activation induced by collagen and other integrin receptors. We tested the hypothesis that FAK-specific pathway activation is also induced during the execution of platelet activation induced by a mechanical stimulus. Isolated platelets from healthy volunteers were submitted to a constant shear stress of 10 Pa. Flow cytometry was used to determine the levels of active, tyrosine phosphorylated FAK at the molecular level, and to quantify the activated platelet population. In parallel, platelet function was measured by the platelet aggregation assay. Our results show that thrombin and shear stress induced the tyrosine phosphorylation of FAK and the recruitment of paxillin to FAs. In addition, the inhibition of FAK phosphorylation with the use of FAK-inhibitor TAE226 inhibited the activation of platelets induced by shear stress, whereas TAE226 had no effect on platelet function induced by thrombin. Finally, the inhibition of FAK activation by TAE226 significantly inhibited the increase in platelet function induced by the execution of platelet aggregation. In conclusion, we showed that shear stress-induced platelet activation is achieved through a FAK-specific pathway activation. Furthermore, these results suggest that FAK activation contributes to platelet activation and a possible link between shear stress-induced integrin activation and FAK activation.Q: Is mysql_fetch_assoc() more efficient than mysql_fetch_row()? I have the following code: while (\$row = mysql_fetch_assoc(\$result)) { echo \$row["city"]. ", ". \$row["state"]. ", ". \$row["zip"]. ", ". \$row["phone"]. ", ". \$row["description"]; } When I run it, I have a couple of hundred thousand records returned. When I run this code: while (\$row = mysql_fetch_row(\$result)) { echo \$row[0]. ", ". \$row[
