rate is expected to increase. This increase in temperature could be a problem for people, animals and plants in a number of ways. A rise in temperature can cause the melting of the polar ice caps, which will lead to the loss of the land that is covered by them. It can also cause the melting of mountain glaciers and the disappearance of ice sheets. These changes will lead to changes in the planet's water cycle, which in turn will lead to a rise in sea level.
