It is well liked by users, with average rating is 4.4. The movie is recommended by 18 users and 35 users added it to their lists of favorite movies. Only users who have signed up within the last year added the movie to their lists of favorites. It has average views by user count, where it has been viewed by 341 users. The synopsis of the movie is viewed by 1621 users out of total 15.254.067 users Q: Java: What is the best way to wrap a class? I have a number of classes in my project. Some of them are simple utility classes which only do things a single method does, and others are more complicated classes which do several things. In order to keep them in one place, I would like to wrap all my classes in a single class. Is there a standard way to do this, or is it something I should just implement myself? A: I would do it manually. The temptation to use a framework is really high. But you will lose a lot of control in the process. You can use the JDK 1.5 module system to accomplish this. Easiest thing to do would be to refactor, but if you have no control of the code base, I would just build a library of utility classes. `com/file/_path/_class__subclass__py) f3e1b3768c`
