In the ad, T-Mobile refers to their tablet computers as a "smart phone" and a "smart phone" is what they are selling. They do not, however, sell a tablet. So what's the deal? Is this a case of software versus hardware? Is this a case of T-Mobile being silly? Is it a case of the Department of Justice trying to get something done on "smart phone" royalties? The

Truth There is a legal definition for what a "smart phone" is. The term "smart phone" has been in the telecommunications business since 1994. The term "smart phone" is defined as "a cellular telephone or other mobile device that has the capability of Internet access and, in the case of mobile devices, is capable of executing applications such as games, financial applications, communication applications, or other such applications (such as audio, video, or image capture applications) available for download or streaming to such devices. Mobile devices that have such capabilities are known as smart phones." That definition covers what T-Mobile is selling in its commercial. T-Mobile's tablet computer is certainly capable of running applications that allow it to communicate with other networks. It can also take pictures and play videos. Why T-Mobile's Ad is a Mistake I will give T-Mobile credit for not calling their tablet a "smart phone" as a mistake, but I don't think it's a smart move to call your tablet a "smart phone" when you don't sell a smart phone. That's just embarrassing.

When you open the Windows Explorer window, you can see the files and folders that are stored on the hard drive. With the touch screen, this list is manipulated by simply touching the icons instead of clicking them. The Touch Pack introduces a way to extend this functionality. If you have Virtual earth 3D installed, the developer recommends removing it from the system in order to avoid compatibility issues that might occur. The Six Pack of Games: The Touch Pack features a total of six games, all ready to be played by tapping on the screen instead of using the mouse. These are casual games designed to provide a fun pastime as well as to put your intelligence to the test. For instance, Microsoft Blackboard requires you to solve a puzzle of getting a balloon to a light bulb. It involves creating a contraption, which, according to the laws of physics, achieves the goal. Less demanding choices include Garden Pond, Rebound,

Surface Globe and Surface Collage. There is also an interactive screensaver, Surface Lagoon, with water simulation that can be manipulated in different ways in order to make the fish respond to the changes. In the case of Surface Globe users have the possibility to explore various areas around the world by simply dragging the fingers on the screen. You can zoom in and out, spin the globe or search for a specific location. Surface Collage enables you to play with multimedia files (video is also supported) and mix them up on the touch-ready display. You can change their position in the collage, bring them to the foreground, resize or rotate them just by letting your fingers glide on the surface. Conclusion: Microsoft Touch Pack is a simple way to demonstrate the touch capabilities of Windows 7. It is not rich in options or applications but it manages to give a hint on how Windows works on a touch screen.
