Gimpel3D Free Download is a 3D modeling tool based on 2D perspective projection and comes with a complete set of tools for rapid creation of models. The user works in a true 3D workspace, allows for highly-accurate editing of models and is naturally intuitive for the user. The editor automatically computes and projects the environment and renders the scene in real time, allowing easy interactive editing of both geometric and photorealistic scenes. Some of the available features include: -- Perspective projection --3D modeling with planes, boxes, cylinders and cones --Model sizes from dozens to millions of polygons --Geometric and photorealistic rendering --Multi-file compressed and uncompressed geometry --Full size and scaled down previews --Support for common file formats --Creation of stereo-photogrammetric point clouds and meshes from image sequences --Automatic creation of a 3D geometrical library --CAD-like workspace with hand held tools, including a "magic wand" and "axis" --Blending of mesh data from various models --Large selection of tools that help you to work fast and efficiently --Translation and rotation of objects and cameras --Point cloud editing and merging --Export to other 3D formats and software (e.g. STL, OBJ, 3DS, 3MF, PLY, VTF, PLY, XML, DXF, OBJ, MD3, MD2, VRML, VRA) --GIS data import and export --Exports to 3D printers and stereo lithography machines --Uses many commonly used formats for both geometry and textures --Huge range of export options --Excellent documentation --Modes for easy creation of 3D objects The documentation for each mode is well-documented and illustrates all the possibilities for both simple and complex models. The tool includes tools for easy-to-use modeling, editing, exporting and rendering. -- 3D modeling and editing -- Elements of the model can be textured and shaded, allowing for different materials to be used to model different surfaces. -- 3D Sculpting -- A set of user-defined parameters for texturing and shading of the model can be created. -- Lighting -- Lighting is computed using standard or 'ad hoc' methods based on the position and orientation of the model. -- 3D Scene

CMD2 - Select a point on the surface of the model CMD3 - Position the camera CMD4 - Move to the position of the selected point CMD5 - Rotate the camera CMD6 - Change the view angle CMD7 - Move the camera so that the object can be seen in the "camera view" CMD8 - "Pull" the object towards the camera so that it can be viewed in 3D. CMD9 - Stop pulling the object towards the camera CMD - To Zoom in or Zoom out This is a great program for the simple creation of 3D scenes. My only complaint is that I can't add things to the scene without bringing everything else down. If I set an object to hover above a specific point on the object, I can move the object but not the object until I hover it over the object again. This would be ok except that this would result in having to constantly move the camera around to view the object as it moves. I could see this program being very useful for the creation of simple 3D scenes in webpages. There's nothing wrong with that but it's really hard to use for something more complex. Gimpel3D 2.0 is a 3D authoring tool to create 3D renderings of real world images. The project uses the free software OpenSceneGraph, the same tool used by the popular software 3D Studio Max to create scenes in true 3D space. With Gimpel3D you can create and edit real world 3D scenes in true proportional space. You can load images from file and from the web. Images can be augmented with plugins from the Gimpel3D plugins repository. You can easily apply 3D effects to the scene or the image inside the scene. Gimpel3D can export scenes as images, as stereo panorama, as stereoscopic images and as 3D stereo sliders. You can also directly export as interactive 3D scene data, suitable for 3D scenes in VR or for 3D rendering. Gimpel3D is able to build almost any 3D scene that you can imagine! GeoMorph is a shapefile editor with a level of quality that makes it ready for professional use. GeoMorph can open, view, edit, and save most common types of shapefiles (ESRI shapefiles, MapInfo shapefiles, PostGIS shapefiles, etc.). GeoMorph can convert and edit almost any existing shapefiles. A full featured editor that can be used to create maps, atlases, and other GIS applications. GeoMorph is also capable of reading and modifying the content of TIGER and TIGER-X files. GeoMorph can also export shapefiles in other formats, using common GIS file format converters. GeoMorph is especially useful for working with large datasets, for example the whole of Belgium. A 3D modeling tool for creating 3D objects. The main difference with many other available modeling tools is the use of "full perspective" instead of the "orthogonal" representation that is common in most other applications.
