Research has been proven to be an effective means of improving the quality of health care. But the implementation of research findings to improve patient care remains controversial. Although research has become a staple of all health care institutions in the United States, research findings are not always translated into tangible benefits for patients. As a result, sometimes the reluctance of health care professionals to adopt research findings that have been proven to be beneficial to patients can be seen. One such area where both medical and nursing leadership have indicated reluctance to adopt research findings is the topic of resuscitation. Lack of scientific rigor, as well as fear of making a decision in emergency situations, has slowed the implementation of the evidence-based American Heart Association (AHA) guidelines. While this topic has been studied in the past, recent trends in the delivery of health care have made the previous research obsolete. These trends include: medical and nursing school curricula have taken on a more clinical focus; patient-centered care is now viewed as a hallmark of quality care; health care providers are more independent in making decisions; and research is now viewed as a vital part of the overall mission of health care institutions.
